

Reasons to shift away from methane gas to modern electric appliances

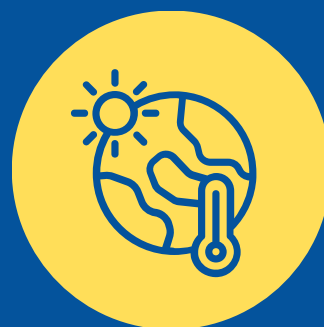

All electric homes lower your energy bills

Modern electric appliances like heat pumps and induction cooktops use less energy and cost less to run than gas.

Gas companies make big profits while households suffer

Gas prices have tripled in the last decade, and big gas companies are making record profits while families struggle to pay their bills.

Burning gas is heating our planet

Methane gas is a polluting fuel that damages our climate. It's responsible for 17% of Victoria's climate pollution.

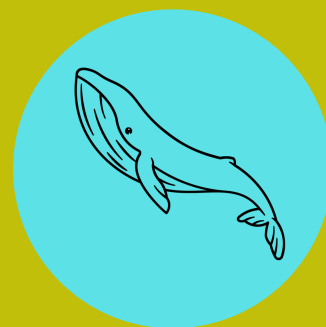

Burning gas indoors is bad for your health

Cooking with gas indoors creates toxic air pollution that drives up asthma rates. It's a similar risk to living with a smoker.

It reserves gas for industries that can't switch to electricity easily

Homes can run on clean electricity, freeing up supply for industries that don't yet have solutions to electrify.

Drilling for gas is destructive for the local environment

Seismic blasting and drilling for new gas damages oceans, wildlife and fragile ecosystems.
